
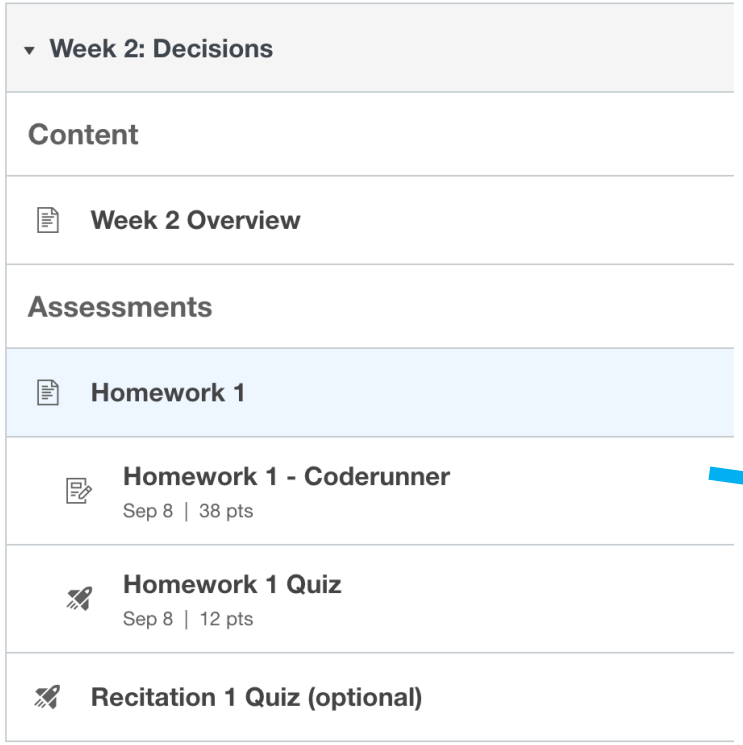
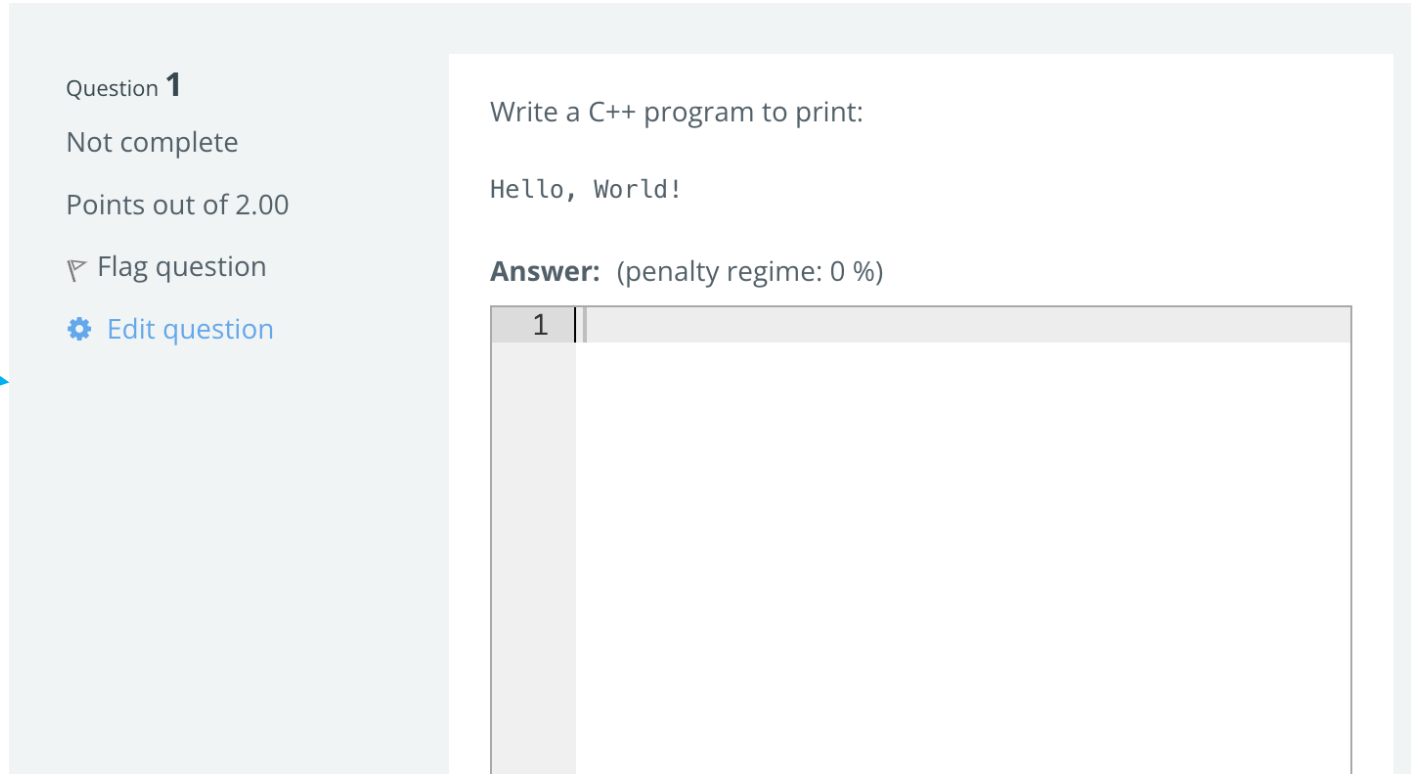
Boolean Operators

Due this week

- **Homework 1**
  - Write solutions in VS Code
  - Paste in Autograder, **Homework 1 CodeRunner**.
  - Complete the quiz
- Check the due date! **No late submissions!!**

Homework 1 - CodeRunner





Today

- Boolean/Logical Operators
- The `if, else-if, else` statement

Boolean/Logical Operators

Logical Operators

- **Example:** you need to write a program to process temperature values, and tests whether a given temperature corresponds to liquid water or to solid ice.
- At sea level, water freezes at 0 degrees Celsius and boils at 100 degrees Celsius.
- Water is liquid IF the temperature is greater than 0 AND less than 100

Logical Operators: And &&

- **Example:** you need to write a program to process temperature values, and tests whether a given temperature corresponds to liquid water or to solid ice.
- At sea level, water freezes at 0 degrees Celsius and boils at 100 degrees Celsius.
- Water is liquid IF the temperature is greater than 0 AND less than 100
- In C++, the && operator (called “and”) yields true only when both conditions that it joins are true:

```
if (temp > 0 && temp < 100)
{
      cout << “Liquid” << endl;
}
```

Truth Tables

- **Definition:** A truth table displays the value of a Boolean operator expression for all possible combinations of its constituent expressions.
- (You'll look at truth tables a lot more in CSCI 2824 (Discrete))
- So if A and B denote bool variables or Boolean expressions, we have:

A	B	A && B
true	true	true
true	false	false
false	true	false
false	false	false

A	B	A || B
true	true	true
true	false	true
false	true	true
false	false	false

A	!A
true	false
false	true

Logical Operators: And &&

```
if (temp > 0 && temp < 100)
{
      cout << "Liquid" << endl;
}
else
{
      cout < "Not liquid" << endl;
}
```

- If temp is within the 0 to 100 range, then both the left-hand side and right-hand side are true, so the whole expression in parens ( ) has value = true
- In all other cases, the whole expression's value is false

Logical Operators: Or ||

- The || operator (called or) yields the result true if at least one of the conditions connected by it is true
- Written as two adjacent vertical bar symbols (above the Enter key)

```
if (temp <= 0 || temp >= 100)
{
     cout << "Not liquid" << endl;
}
```

- If either of the left-hand or right-hand side expressions is true, then the whole expression has value true
- **Question:** What is the only case in which "Not liquid" would appear?

Logical Operators: Not !

- Sometimes, you need to invert a condition with the logical not operator: !
- The ! operator takes a single condition and evaluates to true if the condition is false, and to false if the condition is true

```
if (!frozen)
{
      cout << "Not frozen" << endl;
}
```

- "Not frozen" will be written only when frozen contains the value false
- **Question:** What is the value of !false ?

Examples

- 0 < 200 && 200 < 100
- 0 < 200 || 200 < 100
- 0 < 200 || 100 < 200
- 0 < 200 < 100
- !(0 < 200)
- -10 && 10 > 0
- 0 < x && x < 100 || x == -1
- (!0 < x && x < 100) || x == -1

The if statement

Syntax of the `if()` Statement

```
if (condition)//never put a semicolon after the parentheses!!
{
  statement1; //executed if condition is true
}
else  //the else part is optional
{
  statement2; //executed if condition false
} //braces are optional but recommended
```

Common Error – The Do-nothing Statement

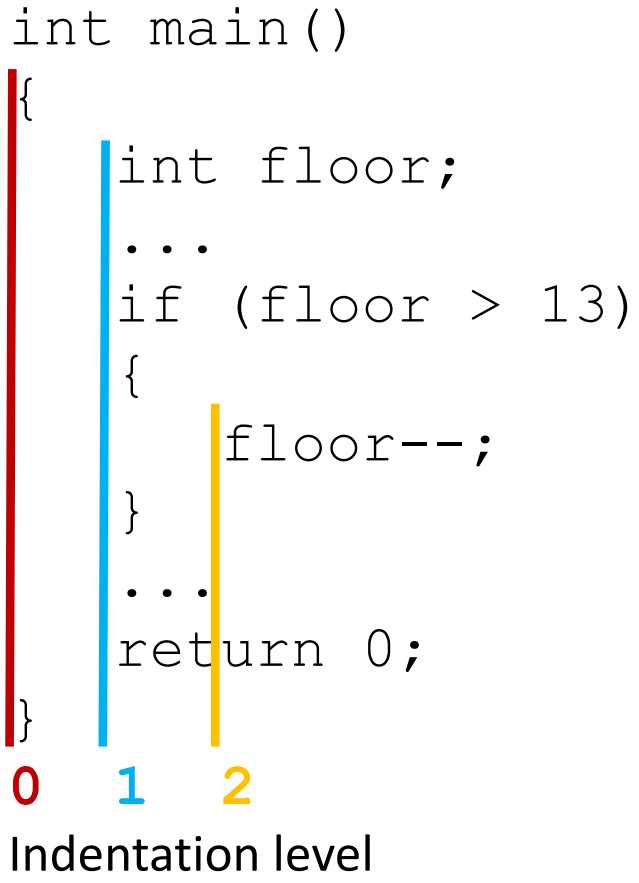
- This is *not* a compiler error.
- The compiler does not complain.
- It interprets this **`if`** statement as follows:
  - If floor is greater than 13, execute the do-nothing statement (semicolon by itself is the do-nothing statement)
  - Then execute the code enclosed in the braces.
- Any statements enclosed in the braces are no longer a part of the if statement.

```
if (floor > 13); // ERROR?
{
    floor--;
}
```

Nested Branches

The `if` Statement – Indent when Nesting

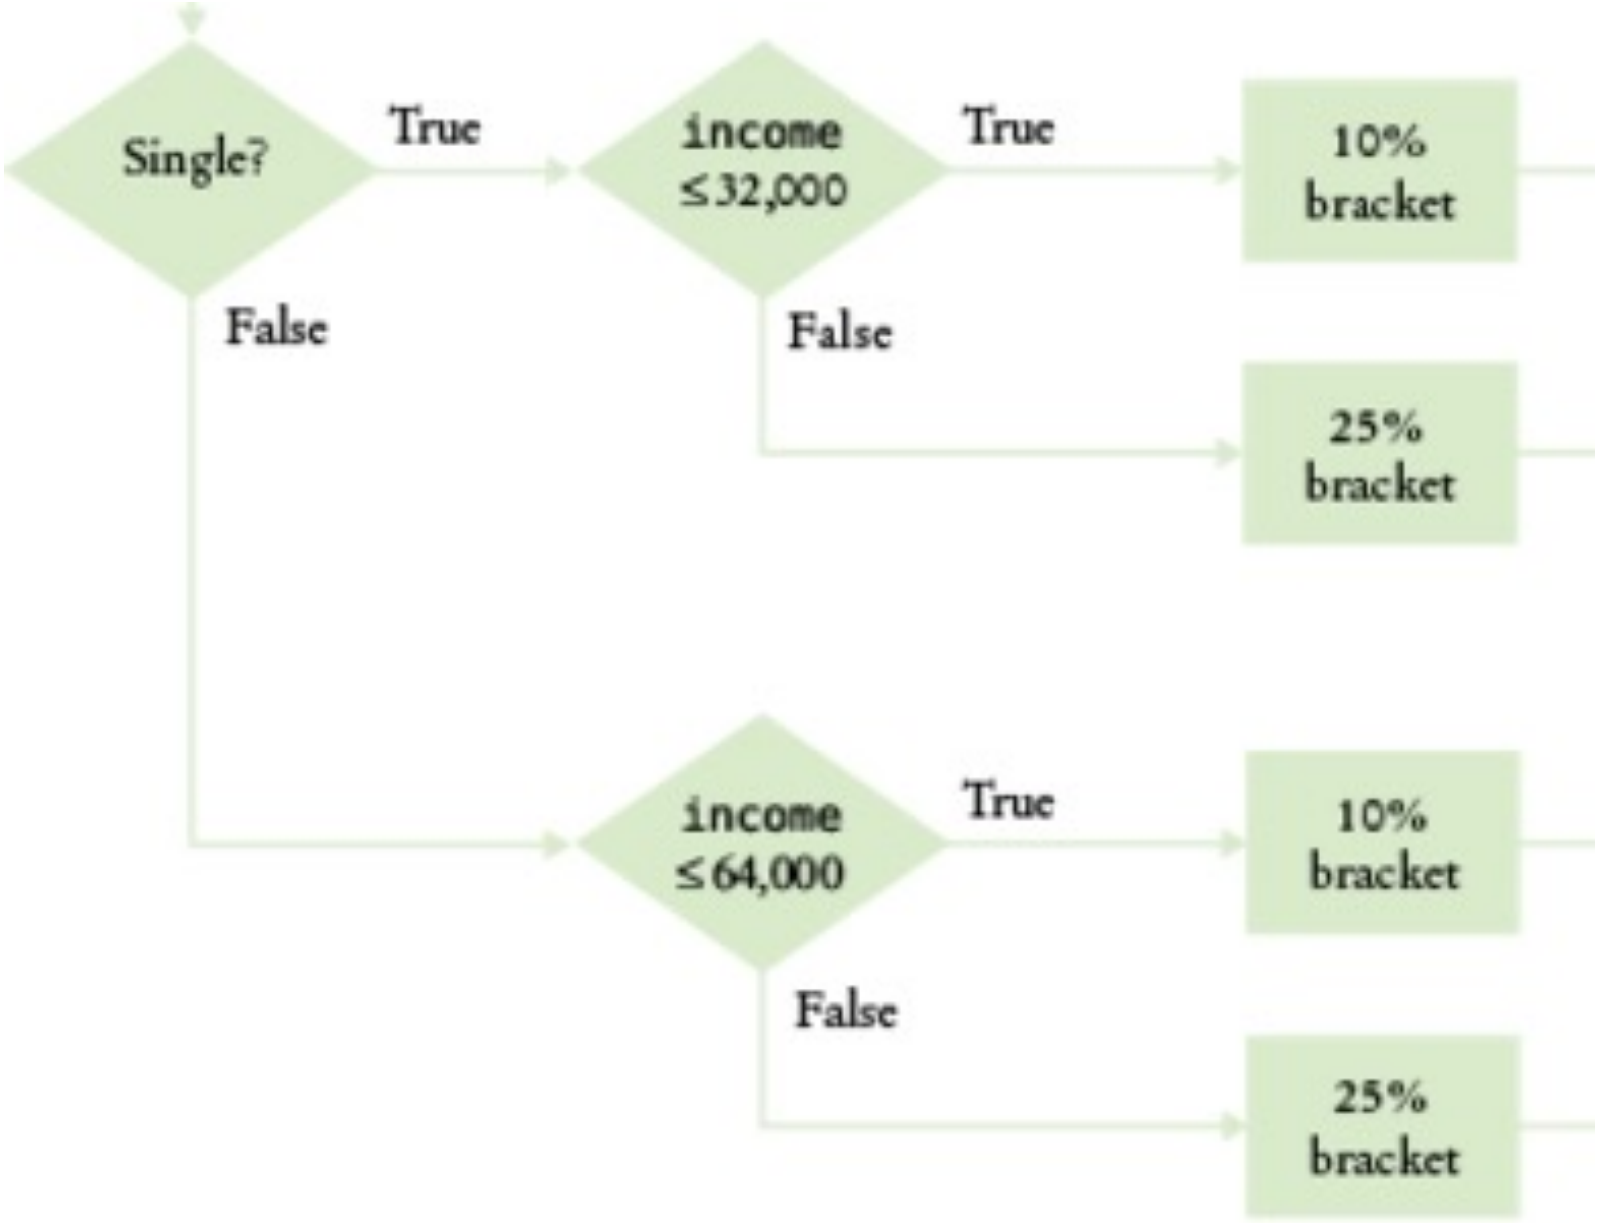
Block-structured code has the property that *nested* statements are indented by one or more levels.



Nested Branches – Taxes

Table 4 Federal Tax Rate Schedule		
If your status is Single and if the taxable income is	the tax is	of the amount over
at most $32,000	10%	$0
over $32,000	$3,200 + 25%	$32,000
If your status is Married and if the taxable income is	the tax is	of the amount over
at most $64,000	10%	$0
over $64,000	$6,400 + 25%	$64,000

In the United States different tax rates are used depending on the taxpayer's marital status – single rates are higher. Married taxpayers add their income together and pay taxes on the total. See the IRS table below from a recent year:



Flowchart for Tax Table Decisions

Nested Branches – Taxes – Complete Code part 1

```
#include <iostream>
#include <string>
using namespace std;
int main()
{
   const double RATE1 = 0.10;
   const double RATE2 = 0.25;
   const double RATE1_SINGLE_LIMIT = 32000;
   const double RATE1_MARRIED_LIMIT = 64000;

   double tax1 = 0;
   double tax2 = 0;

   double income;
   cout << "Please enter your income: ";
   cin >> income;

   cout << "Please enter s for single, m for married: ";
   string marital_status;
   cin >> marital_status;
```

Nested Branches – Taxes – Complete Code part 2

```
if (marital_status == "s")
   {
      if (income <= RATE1_SINGLE_LIMIT)
      {
         tax1 = RATE1 * income;
      }
      else
      {
         tax1 = RATE1 * RATE1_SINGLE_LIMIT;
         tax2 = RATE2 * (income - RATE1_SINGLE_LIMIT);
      }
   }
else
```

Nested Branches – Taxes – Complete Code part 2

```
{
   if (income <= RATE1_MARRIED_LIMIT)
   {
      tax1 = RATE1 * income;
   }
   else
   {
      tax1 = RATE1 * RATE1_MARRIED_LIMIT;
      tax2 = RATE2 * (income - RATE1_MARRIED_LIMIT);
   }
}

double total_tax = tax1 + tax2;

cout << "The tax is $" << total_tax << endl;
return 0;
}
```
